

## SERVICE OVERVIEW

# Delinea Secret Server

Turn scattered administrator passwords into a controlled access process. SYNEDAT supports Delinea Secret Server, Privilege Manager and Privileged Remote Access, from selection and a pilot to deployment with clear ownership.

## How Secret Server helps in daily operations

**Protect credentials centrally**

A governed vault replaces scattered password lists. Authorized teams gain a traceable route to the credentials they need.

**Make privileged accounts visible**

Discovery helps identify accounts and related dependencies, providing a basis for prioritizing critical account onboarding.

**Automate password changes**

Scheduled rotation reduces manual maintenance and long-lived passwords. Dependent services and failure cases are tested before activation.

**Approve access appropriately**

Roles and approvals follow tasks and target systems. Shared credentials can move into a controlled access process.

**Trace administrative activity**

Access logs and separately licensed session features support internal reviews. Retention and analysis are agreed with responsible teams.

**Onboard new systems consistently**

Reusable templates and clear ownership support further account groups. Integrations are checked against vendor support and licensing.

## Where the solution adds value

**Replace shared admin password practices**

Start with a few critical accounts. Test roles, approvals and rotation against actual administration tasks in the pilot.

**Bring service accounts under control**

Map services, tasks and applications using each account. SYNEDAT helps plan password changes and recovery with understood dependencies.

## SERVICE OVERVIEW

## From selection to deployment

### 01 Define requirements and objectives

We review systems, users, security requirements and budget. The result is a reasoned selection with a defined scope.

### 02 Validate suitability in a pilot

For an agreed pilot, we define tests, acceptance criteria and responsibilities. You receive a documented basis for the investment decision.

### 03 Plan rollout and operations

We plan migration, configuration, handover and support together. Scope and responsibilities are agreed before rollout.

## Which product family fits your needs?

### Secret Server

Central privileged credential vault with discovery, rotation and controlled access. SYNEDAT plans account onboarding, roles, dependencies and emergency procedures.

### Privilege Manager

Grant targeted application elevation and reduce local administrator rights. We develop policies with workplace teams and test required exceptions.

### Privileged Remote Access

Controlled remote access for employees and external providers. We align target systems, identities, approvals and session evidence with the agreed product scope.

## Does every license include all Secret Server features?

No. Deployment, editions, integrations and additional session features require a specific review. SYNEDAT describes the required scope and services in the proposal.

## Your next step

Use case, existing systems, user or device count and target start date. For renewals, the product name is enough initially; do not send passwords or license keys.
